The stack grew one piece at a time.

A spreadsheet holds the plan, a request form logs the ask, email carries the quote, and Workday runs the transaction, with Supply Chain hearing about it last.

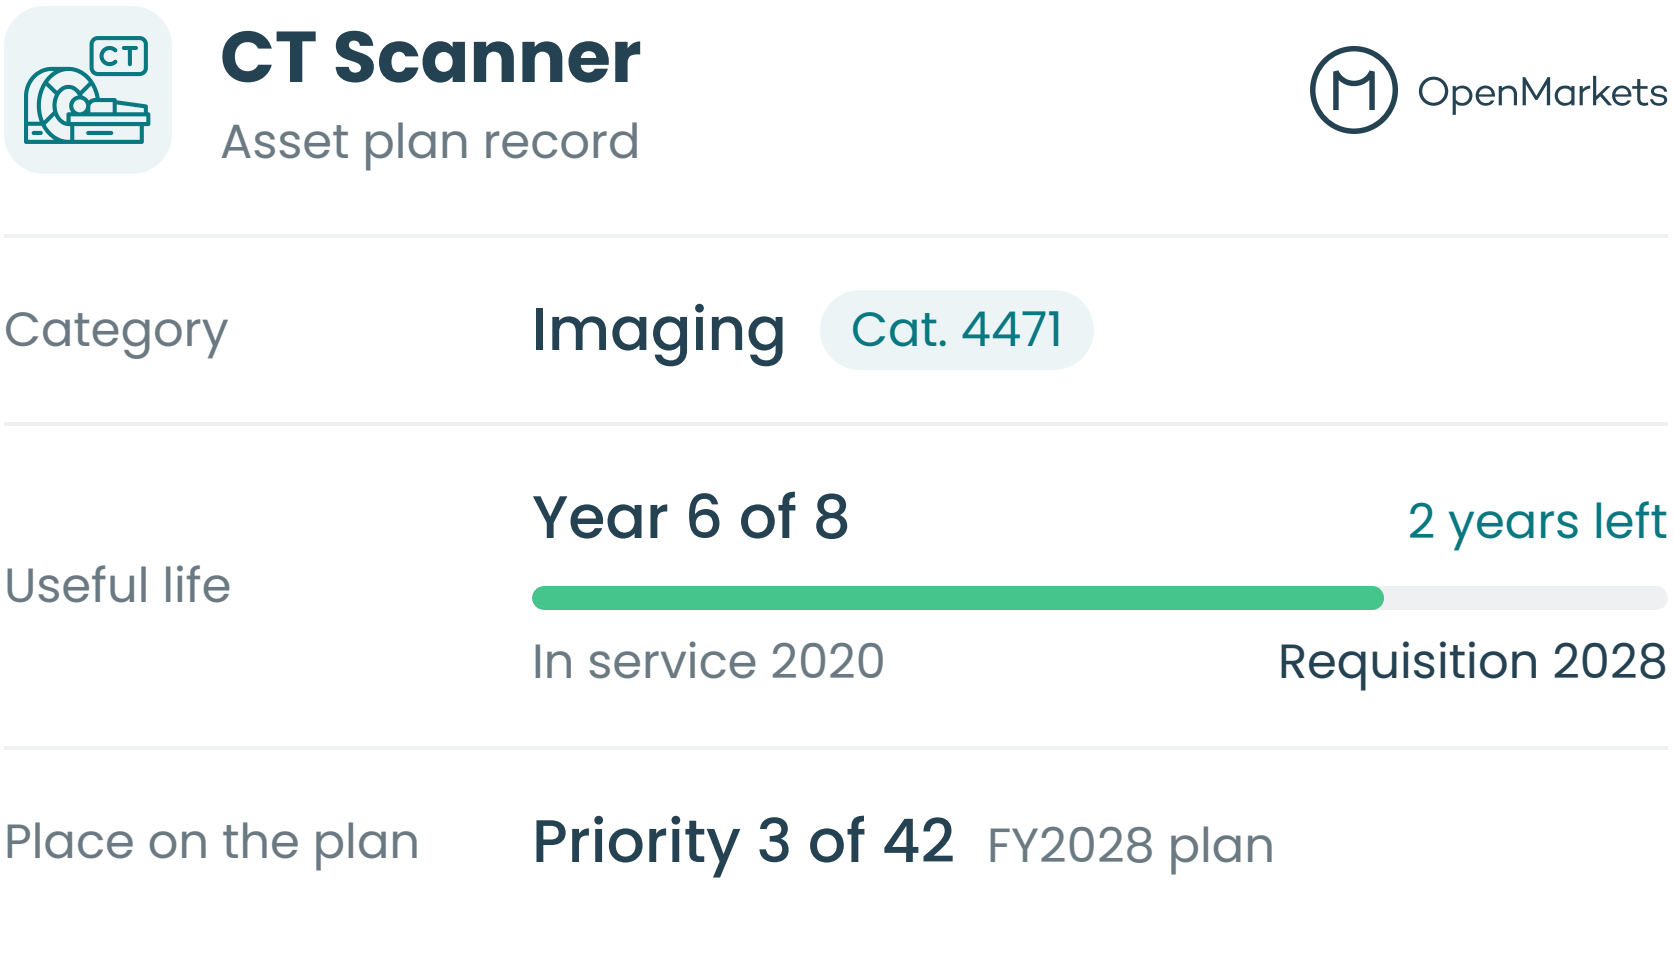

2

WHAT TO KNOW

Long before the requisition.

Replacing a CT scanner means knowing its category, useful life, and place on the plan.

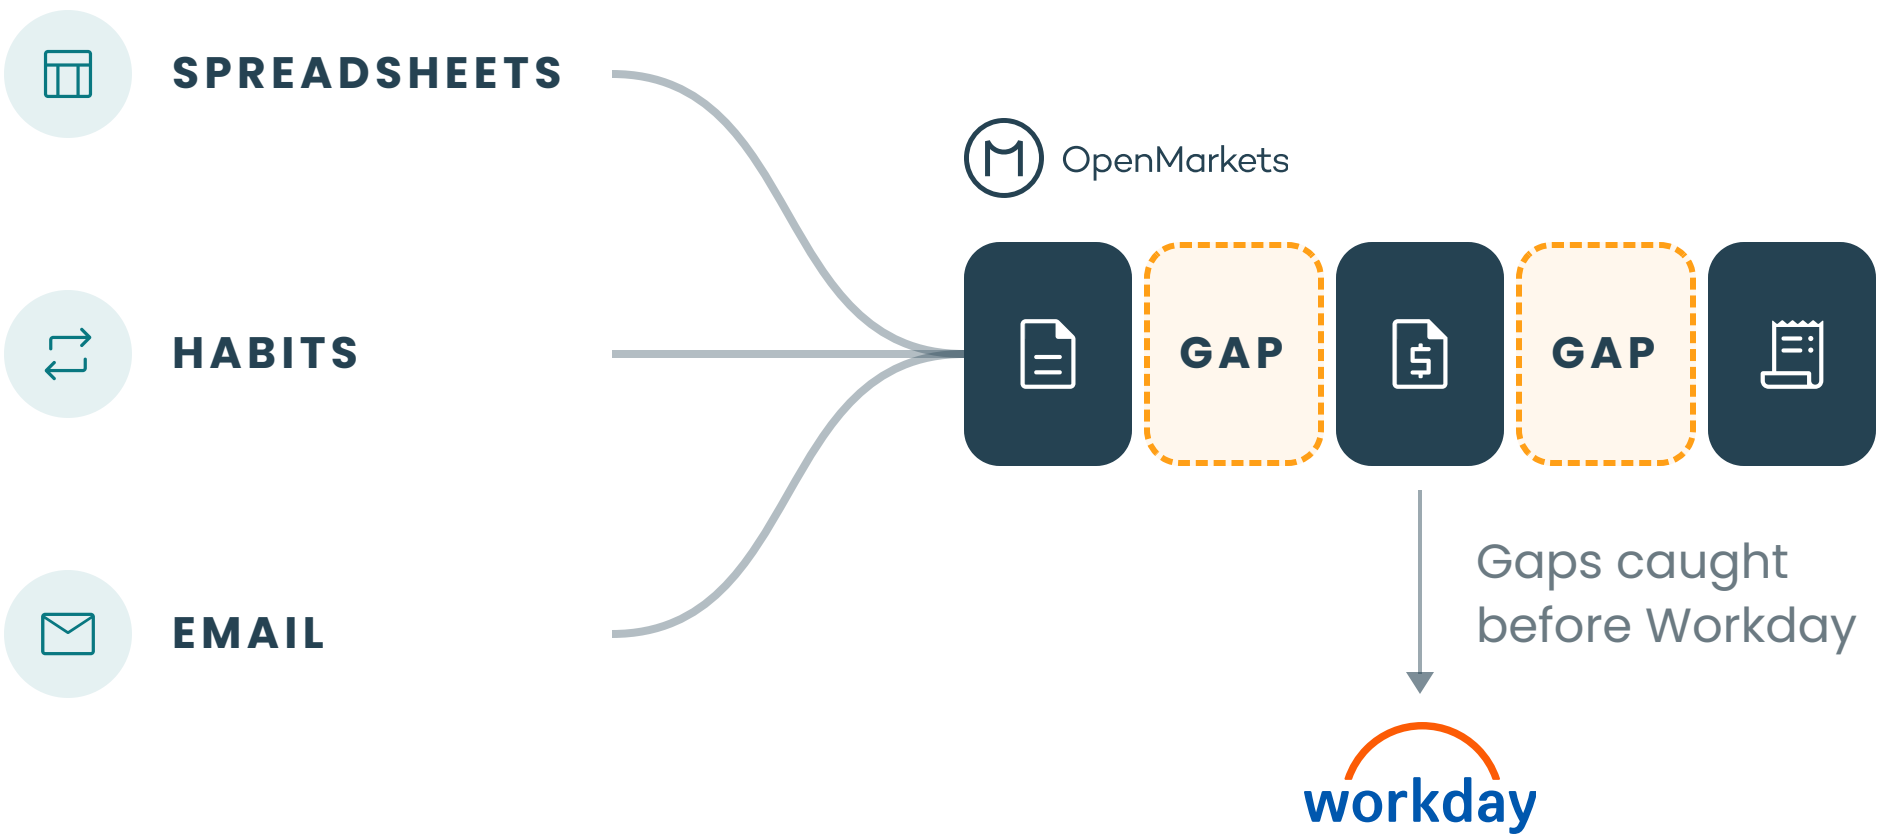

One taxonomy.
One language.

OpenMarkets describes the same piece of equipment the same way, from the first plan to the Workday transaction, so Supply Chain can see a single request as real demand.

Start with the process you have.

Most capital processes are really several, spread across spreadsheets, habits and email threads. Putting that process into one system is what shows the cracks.

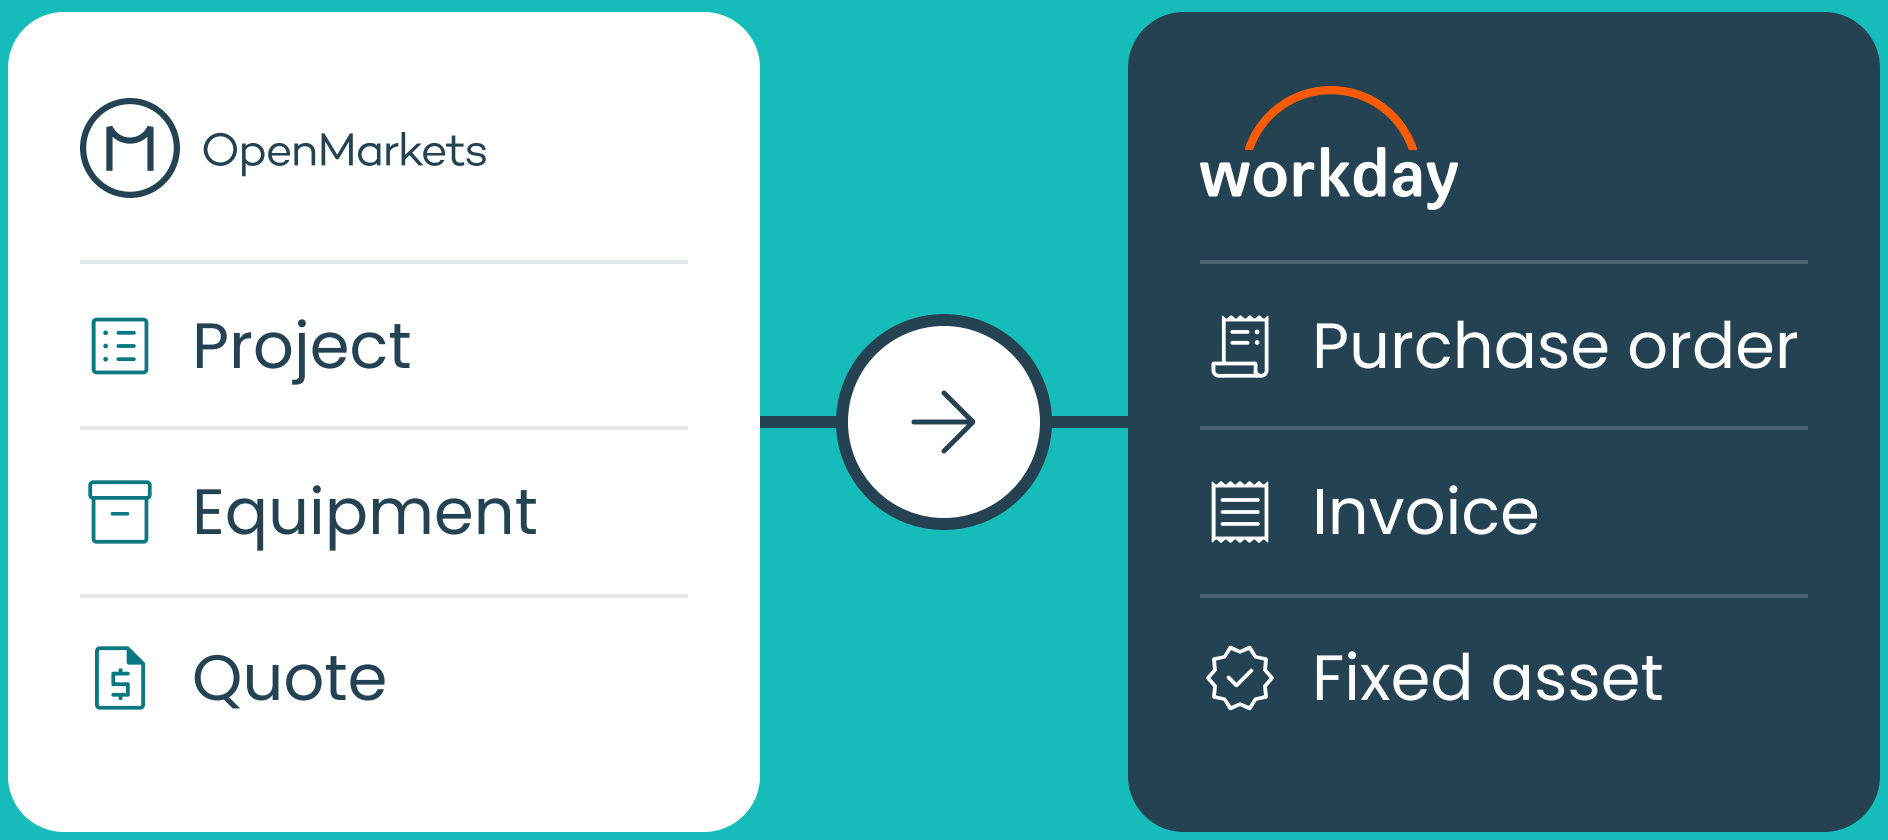

Get there before the quote.

By the time a requisition arrives, the manufacturer and the quote may already be set. A structured front end moves Supply Chain upstream, well before the commitment gets made.

One system plans. The other executes.

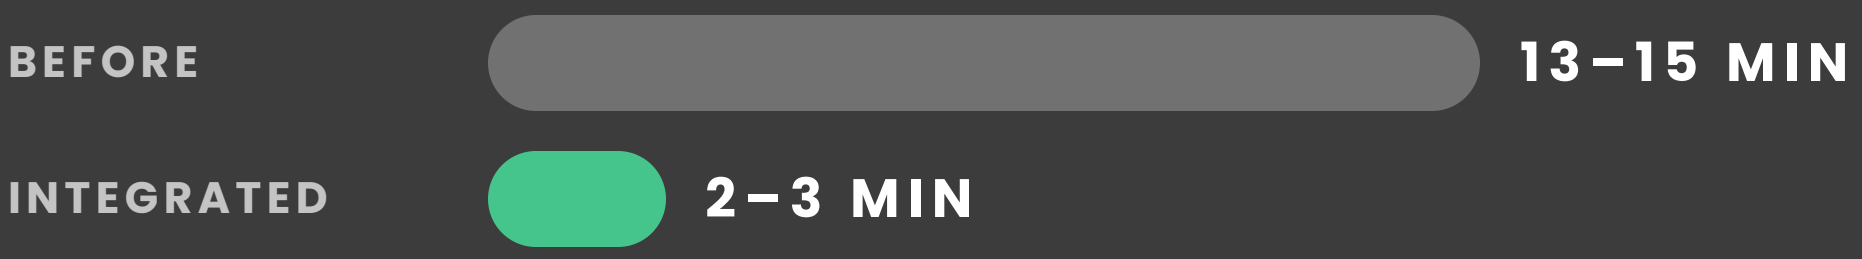

OpenMarkets sits upstream of Workday, without a heavy IT lift. Approved projects, equipment and quotes flow forward automatically, cutting manual entry.

The integration saves real time.

A quote used to take 13 to 15 minutes of manual entry. With the Workday integration live, that drops to 2 to 3, time handed back to the clinical teams who need it most.

80% less admin time on every quote

Admin time per quote, as reported by OpenMarkets clients running the Workday integration

CONNECT THE PLAN

Give Workday a capital front door.

OpenMarkets pulls the asset plan, the request and the quote together in front of your ERP, so leaders can align on decisions before it's too late.
